

Hughes Brothers has been bundling structure kits for many years, including everything from single pole distribution crossarm kits to massive 345kV H-frame kits. With more emphasis being placed on cutting costs, pre-packaging is becoming more common than ever.

## Convenience

The concept of bundled structure kits is a win-win for HB and for our customers. A kit is easier to identify, less complicated to move in and out of inventory, and convenient to lay down at the site. On the receiving end, it's a one-piece unit vs. multiple items scattered around a warehouse or yard, with less likelihood of items being mis-allocated. Utilities and contractors can even drop complete kits at each individual structure location.

## Customization

Hughes Brothers has also purchased products that we don't make to create an even more complete structure kit. We can include insulators, copper conductors, etc. We listen to your ideas and we design our kits to meet your specifications. The bundles are ideal to keep on hand for stock in case of storms. Save time, save money, be better prepared for Mother Nature, and customize the kit for your exact needs.
